

# AIML

MODULE PROJECT

- AIML module projects are designed to have a detailed hands on to integrate theoretical knowledge with actual practical implementations.
- AIML module projects are designed to enable you as a learner to work on realtime industry scenarios, problems and datasets.
- AIML module projects are designed to enable you simulating the designed solution using AIML techniques onto python technology platform.
- AIML module projects are designed to be scored using a predefined rubric based system.
- AIML module projects are designed to enhance your learning above and beyond. Hence, it might require you to experiment, research, self learn and implement.

# AIM

# MODULE PROJECT

# COMPUTER VISION

AIML module project part I consists of task to train and compare image classifier models using supervised learning classifier, neural network classifier and a CNN classifier.

AIML module project part II consists of your observations how CNN outperforms other models.

TOTAL SCORE 30

### PART **ONE**

### PROJECT BASED

TOTAL Score 25

- DOMAIN: Botanical research
- **CONTEXT:** University X is currently undergoing some research involving understanding the characteristics of flowers. They already have have invested on curating sample images. They require an automation which can create a classifier capable of determining a flower's species from a photo
- DATA DESCRIPTION: The dataset comprises of images from 17 plant species. It can be downloaded from TensorFlow [Hint: import tflearn.datasets.oxflower17 as oxflower17 ]
- **PROJECT OBJECTIVE:** Company's management requires an automation which can create a classifier capable of determining a flower's species from a photo

### Steps and tasks: [ Total Score: 25 points]

- 1. Import the data. Analyse the dimensions of the data.
- 2. Preprocess the data.
- 3. Data visualisation:
  - Display the images
  - Display the labels
  - Display images vs labels
  - Apply different filters [ for example: blur, contour, edge detection, emboss, smooth etc.] on the images and display the image.
- 4. Train tune and test AIML image classifier model using:
  - Use supervised learning algorithms for training
  - Use neural networks for training
  - Use CNN for training
  - Use various CNN with transferred learning models for training
  - Compare the results from the above step along with your detailed observations.
- 5. Create a GUI to import the image "Prediction.jpg" and use the above designed AIML image classification model to predict the class/label of this image.

#### Sample GUI:

PART **TWO** 

### QUESTION BASED

TOTAL **SCORE** 

5

• Explain in depth your strategy to maintain and support the AIML image classifier after it in production.

# LEARNING OUTCOME

# "Put yourself in the shoes of an actual"

## DATA SCIENTIST

### THAT's YOU

Assume that you are working at the company which has received the above problem statement from internal/external client. Finding the best solution for the problem statement will enhance the business/operations for your organisation/project. You are responsible for the complete delivery. Put your best analytical thinking hat to squeeze the raw data into relevant insights and later into an AIML working model.

### PLEASE NOTE

Designing a data driven decision product typically traces the following process:

#### 1 Data and insights

Warehouse the relevant data. Clean and validate the data as per the the functional requirements of the problem statement. Capture and validate all possible insights from the data as per the functional requirements of the problem statement. Please remember there will be numerous ways to achieve this. Sticking to relevance is of utmost importance. Pre-process the data which can be used for relevant AIML model.

#### 2. AIML training:

Use the data to train and test a relevant AIML model. Tune the model to achieve the best possible learnings out of the data. This is an iterative process where your knowledge on the above data can help to debug and improvise. Different AIML models react differently and perform depending on quality of the data. Baseline your best performing model and store the learnings for future usage.

#### 3. AIML end product:

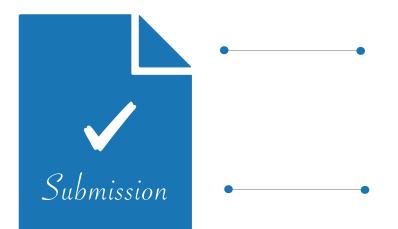

Design a trigger or user interface for the business to use the designed AIML model for future usage. Maintain, support and keep the model/product updated by continuous improvement/training. These are generally triggered by time, business or change in data.

# IMPORTANT POINTERS

Project should be submitted as a single ".html" and ".ipynb" file. Follow the below best practices where your submission should be:

- ".html" and ".ipynb" files should be an exact match.
- Pre-run codes with all outputs intact.
- Error free & machine independent i.e. run on any machine without adding any extra code.
- Well commented for clarity on code designed, assumptions made, approach taken, insights found and results obtained.

Project should be submitted on or before the deadline given by the program office.

Project submission should be an original work from you as a learner. If any percentage of plagiarism found in the submission, the project will not be evaluated and no score will be given.
